

Cloud-Based vs. Cloud-Stored

Same crash. Same insured. Two very different outcomes depending on the camera.

MEETS QEO STANDARD

Footage in minutes

You see the crash before the driver even calls it in. Footage is ready when you need it.

Cloud-Based

Always online. Footage streams off the truck the moment something happens.

- 2:14 PM  Collision detected by accelerometer
- 2:14 PM  Event auto uploaded to cloud
- 2:15 PM  Alert pushed to fleet manager + QEO
- 2:18 PM  Claims Department pulls clip remotely
- 2:25 PM  Liability established from footage

DOES NOT MEET QEO STANDARD

Footage in days

By the time anyone knows what happened, witnesses are gone, stories have changed, and the other side has had a head start.

Cloud-Stored

Saves to a memory card in the cab. Someone must physically pull it later.

- 2:14 PM  Collision occurs
- 2:14 PM  Footage saved to SD card in cab
-  No alert sent. No one knows yet.
- Day 3  Driver returns to yard, card is pulled
- Day 5  Someone uploads footage to a folder

WHAT INSURED MEAN WHEN THEY SAY "CLOUD": Most consumer-grade dashcams advertise cloud features, but the footage only uploads when the vehicle is on Wi-Fi, when the driver taps a button, or after a hard event has already saved locally. That's cloud-stored, not cloud-based. If the camera isn't streaming continuously over cellular, it doesn't meet the QEO standard — regardless of how the box is marketed.

WHAT THIS MEANS FOR YOUR CLAIM

WHEN YOU FIND OUT

Within minutes, automatically.

WHEN YOU FIND OUT

Days later, only after the driver brings the card back.

WHAT YOU CAN DO WITH IT

Pull video remotely, share with adjusters, lock in the story.

WHAT YOU CAN DO WITH IT

Hope the card wasn't damaged, overwritten, or lost in the cab.

HOW THE CLAIM PLAYS OUT

You're first with the facts. Faster close, stronger position.

HOW THE CLAIM PLAYS OUT

You're reacting to someone else's version of events.

THE QEO STANDARD

All insured power units must carry a forward-facing, cloud-based dashcam from an approved provider. Cloud-stored cameras that rely on local recording with manual uploads do not qualify. The camera must be connected, streaming, and accessible remotely.
